

CLEAN VERSION OF ALL OF THE PENDING CLAIMS

Submitted under 37 C.F.R. § 1.121(c)(3)

1. A system for minimizing the loss of information in cordless communications, comprising:

a first data station having control logic, the control logic operable to:

establish a plurality of individual communication channels needed to transmit information between the first data station and a second data station, each of the channels associated with a unique channel frequency, select a first unique channel frequency to be used for the first channel between the two data stations; determine parameters relating to a spectral separation between each of the channels; and select unique channel frequencies for the remainder of the plurality of channels in response to the determined parameters; and

response logic residing in the second data station, the response logic operable to receive the information from the first data station on the plurality of communication channels.

2. The system of Claim 1, wherein the channels are operable to both transmit and receive information in duplex.

3. The system of Claim 1, wherein the parameters comprise a frequency offset to be used between each unique channel frequency.

4. The system of Claim 1, wherein the parameters comprise optimal spectral spacing between each unique channel frequency used for the individual channels.

5. The system of Claim 1, wherein each channel frequency is changed using a frequency hopping scheme.

6. The system of Claim 1, wherein the control logic is further operable to:

a) model interference encountered over individual channels between the data stations; and

b) select parameters that minimize the loss of information over each of the individual channels.

7. A method for minimizing the loss of information in cordless communications, comprising:

- a) establishing a plurality of individual communication channels between at least two data stations;
- b) selecting a first unique carrier frequency to be used for the first of the plurality of channels;
- c) determining parameters relating to achieving a maximum throughput of information over the channels between the data stations; and
- d) selecting additional unique carrier frequencies to be used for the remainder of the plurality of channels, in response to the determined parameters.

8. The method of Claim 7, wherein the maximum throughput of information over the channels is equal to the maximum throughput of information over the plurality of channels.

9. The method of Claim 7, wherein the determining step comprises measuring error rates for a plurality of frequencies usable for each of the channels.

10. The method of Claim 7, wherein the determining step further comprises:
- a) modeling interference over one of the channels; and
 - b) selecting parameters that minimize the loss of information over the plurality of channels.

11. The method of Claim 7, further comprising determining parameters at predetermined intervals of time.

12. The method of Claim 7, further comprising changing the unique frequencies utilizing a frequency hopping scheme.

13. The method of Claim 12, wherein the selecting additional frequencies step comprises separating all of the frequencies at an optimal spectral separation.

14. The method of Claim 7, further comprising selecting all of the unique frequencies from a table.

15. A method for minimizing the loss of information in cordless communications, comprising:

- a) providing at least two data stations having a plurality of communication channels to transmit information between the data stations;
- b) determining a first unique carrier frequency for the first of the channels between the data stations;
- c) determining parameters relating to a spectral separation required for the next one of the channels; and
- d) repeating the process for another channel.

16. The method of Claim 15, wherein the determining parameters step comprises determining parameters to yield an optimal spectral separation.

17. The method of Claim 15, wherein the determining parameters step further comprises:

- a) evaluating whether any signal source is interfering with the channel between the data stations on the first unique carrier frequency; and
- b) selecting another carrier frequency for the channel.

18. The method of Claim 15, wherein the parameters represent an error rate measured over the channel.

19. The method of Claim 15, further comprising the data stations transmitting information that is time division multiplexed and time division duplexed over the communication channels.

20. The method of Claim 15, wherein steps (b)-(d) are performed at regular intervals of time.

21. An apparatus for minimizing the loss of information in cordless communications comprising control logic, the control logic operable to:

- select a first unique channel frequency associated with one of a plurality of communication channels;

- determine one or more parameters relating to a spectral separation between at least two of the channels; and

- select at least one unique channel frequency for the remainder of the plurality of channels using the one or more determined parameters.

22. An apparatus for minimizing the loss of information in cordless communications comprising control logic, the control logic operable to:

- select a first unique channel frequency associated with one of a plurality of communication channels;

- determine one or more parameters relating to achieving a maximum throughput of information over the channels; and

- select at least one unique channel frequency for the remainder of the plurality of channels using the one or more determined parameters.
